

G-Cylinder

Fleet Management Fuel Saving Solutions

SAVES FUEL

Improves Fuel efficiency by 12 - 25%

REDUCES POLLUTION

Exhaust Fumes are reduced by 20 - 60%

REDUCES OPERATING EXPENDITURE

Improved Performance and reduce Carbon Build-up

日本製
MADE IN JAPAN

SAVES FUEL

Every drop counts

Gasoline and Diesel Engines are most widely used on mass transport vehicles causing huge air pollution levels. Emissions from engines in the form of NOx, CO and Hydrocarbons chiefly contribute to the deteriorating air quality. These engines also consume a lot of fuel which now a days is very expensive.

G-Cylinder is the solution for a cleaner environment and to save you fuel. The G-Cylinder works on FIR and Carbon Nano tube technology. It absorbs heat from the engine, and emits (FIR) Far Infrared Rays to condition the fuel, which improves combustion leading to reduced exhaust gases by 0 - 60% and increases fuel efficiency by 12 - 25%.

Solutions span vans, tourist coaches, city transport, school buses operating on Petrol or Diesel.
